

08 Mini Project Report

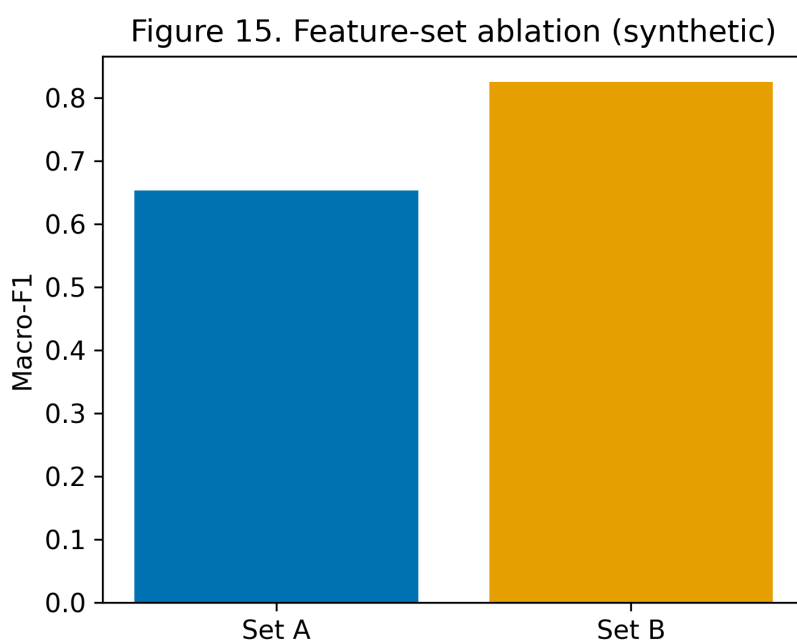

Disclosure: all results use the synthetic fra_synthetic_claims dataset. Scores may reflect generator rules. Real-world performance is unknown. This demo must not drive real claim decisions.

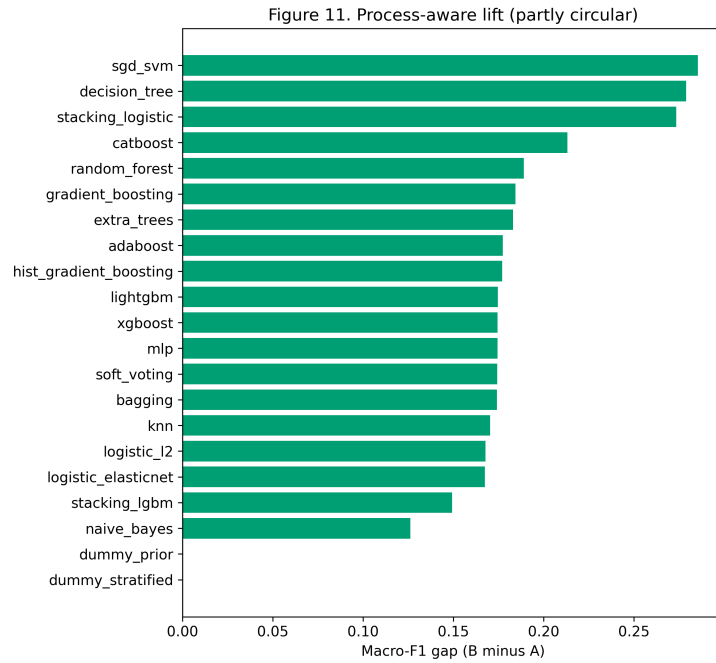

Abstract

We build a leakage-aware claim-outcome DSS on synthetic FRA claims for SIH12508. Filing-time (Set A) models are compared with process-aware (Set B) models under grouped district CV.

Methods

Champion by S1 macro-F1 on Set A: xgboost (S1=0.6468642536953271, final=0.5690448456514766). Set B minus A gap: 0.18053581159110665.

Results and discussion

Random splits (S2) are optimistic versus district-grouped S1. Temporal S3 and leave-one-state-out S4 stress distribution shift.

Extended stats present: True. MoTA forecast caveat: Only four period files were available. With so few time points, forecasts are illustrative only and must not inform policy.

Limitations

Disclosure: all results use the synthetic fra_synthetic_claims dataset. Scores may reflect generator rules. Real-world performance is unknown. This demo must not drive real claim decisions.

High scores may reflect generator rules. Real-world performance is unknown.
